

Colostrum BRIX–Scale Refractometer

Features:

- Accurately test colostrum quality
- Fast and efficient diagnosis
- Reassurance of gold standard colostrum
- Supplied in handy fabric case

Product Information:

This BRIX–scale refractometer enables you to easily test colostrum quality and the levels of antibodies, also known as colostrum immunoglobulin's (IgG), in the quality of cow or mare milk. After checking calibration of the instrument with distilled

water, two drops of the colostrum to be tested are placed on the glass prism. The instrument is then aimed towards the light and the colostrum level (approx. 19% to 24%) is read off the internal scale. Readings above 22% indicate high–quality colostrum. You can start by testing the pooled colostrum. If this is of poor quality you will need to test individual cows as they will give very different results. Supplied in a quality soft fabric carry case, complete with sampling pipette, small screw driver and instructions for use.

NB: Some practice, or expert help, may be required to become proficient in use of this instrument..
