

Electric Milk Warmers

Features:

- Available as Teflon coated or standard
- Reduces build up of milk solids on element
- Heats 100 ltrs from 17°C to 37°C in an hour
- Rheostat controlled

Product Information:

There is no doubt calves do better on warm milk. Our 240v Milk Warmer uses a 2000W element encased in alloy for immersing in milk, or any liquid, to a maximum 70cm depth. For deeper

containers and plastic bottom containers, machine must be suspended or stood on a suitable stand. (Do not suspend warmer by the handles). Rheostat Controlled.

These milk warmers will heat 100ltrs of milk from 17°C to 37°C in approx 1 hour. Lift out and rinse off. For warming large volumes (trailers etc) we suggest you use a standard electric plug timer, set for required time before feeding. Milk will be warm when you are ready to go. NB: Rubbing cooking oil into the element before using will help reduce milk deposits. If used for heating colostrum, you must thin milk with warm water, or stir frequently to prevent build up on element.
